The three main features of my website are:

1.  The pseudo-selectors on the links, turning them white on hover. The purpose behind these pseudo-selectors is so that the user can easily identify that the element is a link and so that the selected link boldly stands out among all the other elements on the page. The significance of this is that it draws the user's attention to the selected element and has a very smooth transition, making the site look very fluid.

2.  The loading animation on each individual page of the website. This slide in is a main animation feature of my website (as you'll see in feature 3) and the significance of it is that it makes the page feel very modern and fluid. Additionally, the purpose behind the loading animation is that certain elements on the page have other unintended animations that I was not able to get rid of due to CSS limitations, but the loading animation overrides that, allowing everything to look uniform.

3.  The sliding projects caption on the projects page. I wanted to keep the projects page clean and without lots of text, focusing on images. The purpose behind the sliding captions is that it allows for a short description of the project while still keeping the smooth look of the page intact. The significance of this feature is it keeps with the general sliding-in animation theme of the website as a whole.
